Abstract

Clethodim, a grass herbicide, was first registered in the US as Select Herbicide for ornamental horticulture crops in 1983 with a limited crop list. From 1997 through 2007, the IR-4 Project completed 122 trials on 76 ornamental plant genera or species examining phytotoxicity related to foliar and/or drench applications of clethodim. In these trials, 7 species or genera exhibited minimal or no injury after foliar applications. Based on this information, it is suggested that all of these crops be added to the list of tolerant plants.

Introduction

Clethodim, a grass herbicide, was first registered in the US as Select Herbicide for ornamental horticulture crops in 1983 with a limited crop list. From 1997 through 2007, the IR-4 Project completed 122 trials on 76 ornamental plant genera or species examining phytotoxicity related to foliar and/or drench applications of acibenzolar.

Materials and Methods

Clethodim was tested as over the top applications, primarily as a single use, but some researchers did apply twice during their experiments. The application rates were 0.25, 0.5, and 1.0 lb ai per acre. All experiments had an untreated control. A minimum of 4 plants (replicate treatments) were required. Phytotoxicity was planned to be recorded on a scale of 0 to 10 (0 = No phytotoxicity; 10 = Complete kill).

Clethodim 1EC was supplied to 12 researchers (See list of researchers in Appendix 1) by Valent as either Envoy or Prism. For the purposes of this summary, the product tested will be referred to as Envoy.

Results and Summary

Based on the type and nature of injury seen with pesticide applications, tested plant species were placed into three categories: 1) no significant phytotoxicity or growth differences from the untreated check or any injury was transitory, 2) no or minimal transitory injury seen at the 1X rate, but the 2X and/or 4X rates did cause significant phytotoxicity, 3) Significant injury sufficient to recommend growers not utilize acibenzolar.

Phytotoxicity

Across all plant species tested, clethodim exhibited no or minimal negative impact (Table 1) on 7 plant genera or species; one crop exhibited primarily minimal injury with the exception of one trial where severe injury was observed (Table 2). Five crops exhibited significant injury (Table 3). There are 63 species or genera where less than 3 trials were conducted for either foliar or drench applications so there is not enough information available at this time (Table 4).

Please see Table 5 for a summary of the individual trial results.

Table 1. List of clethodim treated crops with no or minimal transitory injury.

<i>Brassica</i> sp.	<i>Nepeta</i> sp.
<i>Dryopteris erythrosora</i>	<i>Polystichum acrostichoides</i>
<i>Dryopteris x australis</i>	<i>Polystichum polyblepharum</i>
<i>Forsythia</i> sp.

Label Suggestions

In this report, 7 species or genera exhibited minimal or no injury after foliar and/or drench treatments of acibenzolar. All of these can be added to the EPA label:

Brassica sp.
Dryopteris erythrosora
Dryopteris x australis
Forsythia sp.
Nepeta sp.
Polystichum acrostichoides
Polystichum polyblepharum

In addition, a section where injury after application has been observed may assist growers. It is recommended that *Imperata cylindrical*, *Leymus arenarius*, *Matteuccia struthiopteris*, *Onoclea sensibilis*, and *Salvia splendens* be added to that new section of the label.
